New Technology Allows Ignition Coils a Longer Life

St. Charles, IL October 1, 2004 – Perllo Technologies LLC and ECM Electronics Limited announce that they are introducing the HV200 Series, a technologically advanced high voltage coil into the North American market.

This range of custom designed ignition coils is lightweight and suitable for gas ignition of boilers, furnaces, barbecues, and ovens that require a high gain in voltage that can be provided in a safe and reliable manner. The HV200 Series has an encapsulation made of a unique polymer compound that was developed specifically by ECM. This encapsulation provides a high quality vacuum seal, and therefore eliminates any air pockets around the coil. This innovative design significantly increases the product's reliability by approximately 200% over other coils currently in the market. "We are really proud to introduce this product to the North American market, the improved reliability of our product has meant that our European clients have been able to benefit hugely from the greater reliability that the HV200 series offers", explains ECM Product Manager Dan Weaver. Since being introduced into the European Market four years ago, no user has reported an ignition coil failure out of the approximately 1.5 Million currently in use. One manufacturer of catering ovens saw their cost of field maintenance fall by two-thirds in 2003 after the HV200 coil was adopted.

About Perllo Technologies, LLC: Perllo, founded in 2002, is headquartered in St. Charles, Illinois. The company specializes in engineering design, manufacturing, product management, transportation, and warehousing to provide our clients the best possible product, service and delivery. For additional information, please visit Perllo Technologies' website at www.perllo.com.

About ECM Electronics Limited: ECM Electronics Limited, based in the United Kingdom, was formed in 1988 and is a premier supplier of Crystal Oscillators, and all Frequency Control and Inductive Products.
